TechBridge Sol

Operations Management

Effective Date: January 2026
Applies To: All Operations, DevOps, and Technical Support Staff

1. Purpose

The purpose of this Operations Policy is to define procedures and responsibilities for managing TechBridge Sol's IT infrastructure, cloud deployments, monitoring, and incident management. These guidelines ensure system reliability, business continuity, and operational efficiency across global teams.

Compliance with this policy is mandatory for all staff involved in operations, DevOps, or technical support.

2. Scope

This policy applies to:

- Cloud infrastructure (AWS or other platforms)
- Internal and external production systems
- Monitoring, logging, and alerting tools

- Incident response and disaster recovery procedures
- Third-party vendor services supporting operations

All activities must comply with company IT, security, and regulatory standards.

3. Cloud Deployment Policy

All deployments to production or staging environments must follow structured procedures:

- **Infrastructure as Code (IaC):** Use Terraform, CloudFormation, or equivalent for repeatable provisioning
- **Environment Separation:** Maintain separate environments for development, testing, staging, and production
- **Version Control:** Deployment scripts and configuration must be stored in Git and follow the company branching model
- **Approval Process:** Production deployments require CI/CD pipeline success and management approval
- **Rollback Procedures:** Document rollback plans for all deployments

Unapproved changes to production are strictly prohibited.

4. Monitoring and Alerting

Operational monitoring ensures high availability and performance of company systems:

- **Monitoring Tools:** Use approved tools for server health, application performance, and security events
- **Alerting:** Set thresholds for CPU, memory, network, and application errors
- **Incident Detection:** Automatic alerts are triggered for anomalies or outages
- **Documentation:** All alerts and monitoring metrics must be logged and reviewed periodically

Operations teams are responsible for investigating alerts promptly and escalating as required.

5. Incident Management

All operational incidents must follow a structured workflow:

1. **Detection:** Identify and document the incident promptly
2. **Classification:** Assign severity level based on impact and urgency
3. **Response:** Resolve incidents according to standard procedures
4. **Escalation:** Notify management or senior engineers for high-impact incidents
5. **Recovery:** Restore affected systems with minimal downtime
6. **Post-Incident Review:** Document root cause, lessons learned, and preventive actions

Incident logs must be maintained for compliance, audit, and continuous improvement.

6. Backup and Disaster Recovery

To ensure business continuity:

- Critical data and configurations must be backed up regularly
- Backups must be stored securely offsite or in cloud storage
- Recovery procedures must be tested periodically
- RTO (Recovery Time Objective) and RPO (Recovery Point Objective) targets must be defined for each system

Recovery plans must be updated after significant changes in infrastructure or applications.

7. Vendor and Third-Party Management

Operations teams must manage third-party services carefully:

- Ensure vendors comply with company security, privacy, and operational policies
- Maintain documentation of contracts, service-level agreements (SLAs), and contact points
- Monitor vendor performance and escalate issues as necessary
- Integrate vendor monitoring into overall operational dashboards

8. Change Management

All operational changes follow a strict change management process:

- Submit detailed change requests with impact assessment and rollback plan
- Obtain approval from Operations Manager or Change Advisory Board
- Schedule changes to minimize disruption to services
- Document execution, testing, and verification steps

Unapproved or emergency changes must be documented and reviewed retroactively.

9. Operational Reporting

Regular reporting ensures transparency and accountability:

- Daily system health reports and uptime metrics
- Weekly operational summary including incidents and resolutions
- Monthly review of KPIs, SLA compliance, and security metrics
- Post-mortem reports for major incidents or outages

Reports are shared with IT management, engineering leads, and relevant stakeholders.

10. Compliance and Security

Operations staff must comply with:

- IT Security Policy
- Acceptable Use Policy
- Cloud provider security guidelines
- Industry regulations (e.g., GDPR, ISO 27001)

Security incidents or policy violations must be reported immediately to IT Security.

11. Policy Review and Updates

This Operations Policy will be reviewed annually or whenever significant changes occur in infrastructure, technology, or business needs. Staff are expected to comply with the latest version and follow updates communicated by management.
